

Supplemental Figure 1. Additional Fluorescein angiography images in two different eyes. Images immediately taken after (A/E), at 30 seconds (B/F), 60 seconds (C/G) and at 90 seconds (D/H) post-tracer introduction. Post-limbal high- and low flow regions could be identified unambiguously in both eyes and are marked using green (high-flow) and red (low-flow) arrows in the images taken at 90 seconds (D/H).

Supplemental Figure 2. Outflow facility before and after fluorescein angiography has been performed during preliminary experiments (n=3).
